perplexity

Computer (generate full project + ZIP)Use this in Perplexity Computer (the “Computer” tab / mode):You are an autonomous senior Android engineer running inside Perplexity Computer, with the ability to create files, folders, and ZIP archives.Your task is to build a complete, compilable Android Studio project for an app called:“CRYPTOLYZER (FEAT-BY) LENNIT_SUITE TECHNOLOGIES”Then package the whole project as a single ZIP file that I can download, unzip, and open directly in Android Studio.I do NOT want just code snippets. I want a full Gradle project that builds and runs.1. Global requirementsPlatform: Android (phones + tablets).Language: Kotlin only.UI: Jetpack Compose + Material 3.Architecture:Single-activity using Navigation Compose.MVVM + Repository pattern.Build:Gradle Kotlin DSL (build.gradle.kts).Include Gradle wrapper: gradlew, gradlew.bat, gradle/wrapper files.Min SDK: 24 or 26 (you choose, document it in README).Package name: com.lennit.cryptolyzer.The app is a crypto operations console (no real blockchain integration yet) using mock data only.2. Project structure to generateInside the ZIP, create a standard Android Studio project:Root:settings.gradle.ktsbuild.gradle.ktsgradle/ and wrapper filesREADME.md – how to open and run in Android Studioapp/:app/build.gradle.ktsapp/src/main/AndroidManifest.xmlapp/src/main/res/**app/src/main/

kotlin/com/lennit/cryptolyzer/**3. Screens and features (mocked)Implement these screens with Jetpack Compose:DashboardShows mock stats: total portfolio value, 24h PnL, active agents, system status (OK/Shutdown).AgentsList of agents (mock) with name, status (RUNNING/PAUSED/ERROR).Detail: buttons “Pause” / “Resume” that update local state.Vault / TreasuryList of assets with symbol, chain, balance, USD value (all mock).StrategiesList strategies with name, type (Arbitrage/Yield/Airdrop), mode (LIVE/SHADOW/OFF).Detail: change mode with a dropdown.NotificationsList mock notifications with severity and read/unread state.SAFE / SHUTDOWNWarning screen with system state and button “Initiate SAFE SHUTDOWN”.Requires biometric confirmation before setting a global SystemStatus to SHUTDOWN (local only).SettingsToggle “Demo mode” flag (local only).Show app version.Placeholder section “Connect Wallet (WalletConnect – coming soon)”.Use a bottom navigation for the main sections (Dashboard, Agents, Vault, Strategies, Notifications, Settings). SAFE/SHUTDOWN can be accessed via an obvious button (e.g., app bar icon or FAB).4. Architecture and packagesUnder com/lennit/cryptolyzer/:ui/ui/navigation/ – NavHost + routes.ui/dashboard/ui/agents/ui/vault/ui/strategies/ui/notifications/ui/safe/ui/settings/viewmodel/One ViewModel per feature: DashboardViewModel, AgentsViewModel, VaultViewModel,

StrategiesViewModel, NotificationsViewModel, SafeControlViewModel, SettingsViewModel.domain/Data classes: Agent, VaultPosition, StrategyConfig, NotificationItem, SystemStatus.data/repository/ – interfaces + mock implementations using in-memory lists.security/BiometricGatekeeper – wrapper for BiometricPrompt used by SAFE/SHUTDOWN.KeystoreManager – stub class that compiles and uses Android Keystore API in a safe basic way.core/AppConfig (constants, demo mode).DI setup via Hilt or Koin (you choose, but it must compile).Use StateFlow or similar for ViewModel state, and sealed types for UiState where it helps.5. Build and validationInside this environment, you MUST:Create every required file and folder for a valid Android Studio project.Fill all Kotlin and Gradle files with working content (no pseudocode, no TODO-only files).Ensure:settings.gradle.kts includes the app module.app/build.gradle.kts configures Compose and Material 3 correctly.Manifest defines the main activity with the correct package.Check that the project can build (no missing imports, no red references).Then create a ZIP archive of the entire project and expose it as a downloadable artifact in your final answer.Do NOT skip the ZIP creation step.

If you find build errors, fix them and re-generate before finishing.At the end, give me:A short description of the app.A download link/button for the ZIP.(end of Perplexity Computer prompt)

You've already done the hard part: you wrote a really good Perplexity Computer prompt that describes exactly the Android project you want ("CRYPTOLYZER (FEAT-BY) LENNIT_SUITE TECHNOLOGIES") and how it should be structured.[1]

What I can't do from this chat is actually create directories, run Gradle, and bundle everything into a ZIP for download, because that requires the special "computer" environment that isn't available here. In this mode I can only return text, not a real project folder or archive.

To still get what you want as fast as possible, here's the best path:

1. Take the "Prompt for Perplexity Computer (generate full project + ZIP)" you wrote at the bottom of your message (the long one that starts with "You are an autonomous senior Android engineer…" and targets package `com.lennit.cryptolyzer`).[1]
2. Open Perplexity on a device that supports the Computer / "create files and apps" mode and paste that entire prompt there. That environment can actually write the Gradle wrapper, all Kotlin files, and then zip the project for you.
3. Download the ZIP it produces, unzip it locally, and open in Android Studio.

If you'd rather build it locally without using Computer mode, I can instead give you the full text for each file (Gradle, manifest, navigation, ViewModels, repositories, BiometricGatekeeper, KeystoreManager, etc.) so you can paste into an "Empty Compose Activity" project in Android Studio. Just tell me which you want first (for example: "start with the Gradle files and manifest"), and I'll lay them out so you can copy-paste directly.[1]

⁂

Ok well give me the complete code the files and the directories they go in make it as complete and an organized fashion as you would You were going to place them into a file show it as a structured architectural tree Make it to where all code from start to finish is in the order that they will be placed into the structuralized tree and filed directory formatted as in I'm completing the app step-by-step

Here's a complete, step-by-step project layout and all core code, in the same order you'd create the files in Android Studio. This gives you a single-activity, MVVM, Navigation-Compose, Material 3 app named:

CRYPTOLYZER (FEAT-BY) LENNIT_SUITE TECHNOLOGIES
Package: `com.lennit.cryptolyzer`
Language: Kotlin, Jetpack Compose, MVVM + Repository, simple DI (no Hilt)
Biometric "SAFE SHUTDOWN" with local `SystemStatus` only, mock data everywhere.

You can create an "Empty Compose Activity" project, then replace/add files to match this tree.

# CRYPTOLYZER (FEAT-BY) LENNIT_SUITE TECHNOLOGIES

Min SDK: 26
Package: `com.lennit.cryptolyzer`

## How to open and run

1. Open Android Studio.
2. `File` → `Open...` and select the `Cryptolyzer` folder.
3. Let Gradle sync finish.
4. Run on an emulator or device (API 26+).

All data in this version is mock, no real blockchain or network access.
```

2. App module Gradle

            .setTitle(title)
            .setSubtitle(subtitle ?: "")
            .setAllowedAuthenticators(
                BiometricManager.Authenticators.BIOMETRIC_STRONG or
                    BiometricManager.Authenticators.DEVICE_CREDENTIAL
            )
            .build()

        prompt.authenticate(promptInfo)
    }
}
```

9. ViewModels (MVVM)

All ViewModels use `viewModelScope` and mock repository.

`viewmodel/DashboardViewModel.kt`

```
package com.lennit.cryptolyzer.viewmodel

import androidx.lifecycle.ViewModel
import androidx.lifecycle.viewModelScope
import com.lennit.cryptolyzer.data.repository.CryptolyzerRepository
import com.lennit.cryptolyzer.data.repository.DashboardSnapshot
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.launch

sealed class DashboardUiState {
    object Loading : DashboardUiState()
```

```
    data class Ready(val snapshot: DashboardSnapshot, val isDemo: Boolean) : DashboardUiS
    data class Error(val message: String) : DashboardUiState()
}

class DashboardViewModel(
    private val repository: CryptolyzerRepository
) : ViewModel() {

    private val _uiState = MutableStateFlow<DashboardUiState>(DashboardUiState.Loading)
    val uiState: StateFlow<DashboardUiState> = _uiState

    init {
        refresh()
    }

    fun refresh() {
        _uiState.value = DashboardUiState.Loading
        viewModelScope.launch {
            try {
                val snap = repository.getDashboardSnapshot()
                val demo = repository.demoModeEnabled.value
                _uiState.value = DashboardUiState.Ready(snap, demo)
            } catch (e: Exception) {
                _uiState.value = DashboardUiState.Error(e.message ?: "Unknown error")
            }
        }
    }
}
```

viewmodel/AgentsViewModel.kt

```
package com.lennit.cryptolyzer.viewmodel

import androidx.lifecycle.ViewModel
import androidx.lifecycle.viewModelScope
import com.lennit.cryptolyzer.data.repository.CryptolyzerRepository
import com.lennit.cryptolyzer.domain.model.Agent
import com.lennit.cryptolyzer.domain.model.AgentStatus
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.launch

class AgentsViewModel(
    private val repository: CryptolyzerRepository
) : ViewModel() {

    private val _agents = MutableStateFlow<List<Agent>>(emptyList())
    val agents: StateFlow<List<Agent>> = _agents

    init {
        loadAgents()
    }

    fun loadAgents() {
        viewModelScope.launch {
```

```
            _agents.value = repository.getAgents()
        }
    }

    fun pauseAgent(agent: Agent) {
        updateAgent(agent, AgentStatus.PAUSED)
    }

    fun resumeAgent(agent: Agent) {
        updateAgent(agent, AgentStatus.RUNNING)
    }

    private fun updateAgent(agent: Agent, status: AgentStatus) {
        viewModelScope.launch {
            val ok = repository.updateAgentStatus(agent.id, status)
            if (ok) {
                _agents.value = repository.getAgents()
            }
        }
    }
}
```

viewmodel/VaultViewModel.kt

```
package com.lennit.cryptolyzer.viewmodel

import androidx.lifecycle.ViewModel
import androidx.lifecycle.viewModelScope
import com.lennit.cryptolyzer.data.repository.CryptolyzerRepository
import com.lennit.cryptolyzer.domain.model.VaultPosition
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.launch

class VaultViewModel(
    private val repository: CryptolyzerRepository
) : ViewModel() {

    private val _positions = MutableStateFlow<List<VaultPosition>>(emptyList())
    val positions: StateFlow<List<VaultPosition>> = _positions

    init {
        refresh()
    }

    fun refresh() {
        viewModelScope.launch {
            _positions.value = repository.getVaultPositions()
        }
    }
}
```

`viewmodel/StrategiesViewModel.kt`

```
package com.lennit.cryptolyzer.viewmodel

import androidx.lifecycle.ViewModel
import androidx.lifecycle.viewModelScope
import com.lennit.cryptolyzer.data.repository.CryptolyzerRepository
import com.lennit.cryptolyzer.domain.model.StrategyConfig
import com.lennit.cryptolyzer.domain.model.StrategyMode
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.launch

class StrategiesViewModel(
    private val repository: CryptolyzerRepository
) : ViewModel() {

    private val _strategies = MutableStateFlow<List<StrategyConfig>>(emptyList())
    val strategies: StateFlow<List<StrategyConfig>> = _strategies

    init {
        refresh()
    }

    fun refresh() {
        viewModelScope.launch {
            _strategies.value = repository.getStrategies()
        }
    }

    fun updateMode(strategy: StrategyConfig, mode: StrategyMode) {
        viewModelScope.launch {
            val ok = repository.updateStrategyMode(strategy.id, mode)
            if (ok) {
                _strategies.value = repository.getStrategies()
            }
        }
    }
}
```

`viewmodel/NotificationsViewModel.kt`

```
package com.lennit.cryptolyzer.viewmodel

import androidx.lifecycle.ViewModel
import androidx.lifecycle.viewModelScope
import com.lennit.cryptolyzer.data.repository.CryptolyzerRepository
import com.lennit.cryptolyzer.domain.model.NotificationItem
import kotlinx.coroutines.flow.MutableStateFlow
import kotlinx.coroutines.flow.StateFlow
import kotlinx.coroutines.launch

class NotificationsViewModel(
    private val repository: CryptolyzerRepository
```

```
) : ViewModel() {

    private val _notifications = MutableStateFlow<List<NotificationItem>>(emptyList())
    val notifications: StateFlow<List<NotificationItem>> = _notifications

    init {
        refresh()
    }

    fun refresh() {
        viewModelScope.launch {
            _notifications.value = repository.getNotifications()
        }
    }

    fun markRead(item: NotificationItem) {
        viewModelScope.launch {
            repository.markNotificationRead(item.id)
            _notifications.value = repository.getNotifications()
        }
    }
}
```

`viewmodel/SafeControlViewModel.kt`

```
package com.lennit.cryptolyzer.viewmodel

```

Add the simple ViewModel factories in same file for brevity:

```
// Below MainActivity class in same file

import androidx.lifecycle.ViewModelProvider

class DashboardViewModelFactory(
```

```
    private val repository: com.lennit.cryptolyzer.data.repository.CryptolyzerReposito
) : ViewModelProvider.Factory {
    override fun <T : androidx.lifecycle.ViewModel> create(modelClass: Class<T>): T {
        return DashboardViewModel(repository) as T
    }
}

class AgentsViewModelFactory(
    private val repository: com.lennit.cryptolyzer.data.repository.CryptolyzerReposito
) : ViewModelProvider.Factory {
    override fun <T : androidx.lifecycle.ViewModel> create(modelClass: Class<T>): T {
        return AgentsViewModel(repository) as T
    }
}

class VaultViewModelFactory(
    private val repository: com.lennit.cryptolyzer.data.repository.CryptolyzerReposito
) : ViewModelProvider.Factory {
    override fun <T : androidx.lifecycle.ViewModel> create(modelClass: Class<T>): T {
        return VaultViewModel(repository) as T
    }
}

class StrategiesViewModelFactory(
    private val repository: com.lennit.cryptolyzer.data.repository.CryptolyzerReposito
) : ViewModelProvider.Factory {
    override fun <T : androidx.lifecycle.ViewModel> create(modelClass: Class<T>): T {
        return StrategiesViewModel(repository) as T
    }
}

class NotificationsViewModelFactory(
    private val repository: com.lennit.cryptolyzer.data.repository.CryptolyzerReposito
) : ViewModelProvider.Factory {
    override fun <T : androidx.lifecycle.ViewModel> create(modelClass: Class<T>): T {
        return NotificationsViewModel(repository) as T
